The heterocyclic ring that R³ and R⁵, R⁷ and R⁸, R⁹ and R¹⁰, R¹³ and R¹⁴ or R¹⁵ and R¹⁶ (together with the nitrogen atom to which they are bound) may represent may be any heterocyclic ring that contains at least one nitrogen atom, and which ring forms a stable structure when attached to the remainder of the molecule *via* the essential nitrogen atom (which, for the avoidance of doubt, is the atom to which R³ and R⁵, R⁷ and R⁸, R⁹ and R¹⁰, R¹³ and R¹⁴ or R¹⁵ and R¹⁶ are attached respectively). In this respect, heterocyclic rings that R³ and R⁵, R⁷ and R⁸, R⁹ and R¹⁰, R¹³ and R¹⁴ or R¹⁵ and R¹⁶ (together with the nitrogen atom to which they are bound) may represent include four- to twelve-membered, preferably four- to ten-membered, ring systems, which rings contain at least one nitrogen atom and optionally contain one or more further heteroatoms selected from nitrogen, oxygen and/or sulfur, and which rings may contain one or more double bonds or be non-aromatic, partly aromatic or wholly aromatic in character. The term thus includes groups such as azetidiny, pyrrolidinyl, imidazolyl, indolyl, triazolyl, tetrazolyl, morpholinyl, piperidinyl, pyrazolyl and piperazinyl.

In a particular embodiment, a compound of formula IV is formed *in situ* by
10 reaction at low to ambient temperature (e.g. -10 to 25°C) of a compound of formula XV with hydrazine hydrate in an alcoholic solution. This is followed by addition of a compound of formula III, after which the mixture is brought to reflux, eventually yielding a compound of formula II.

20 Compounds of formula XVIII, where Y represents CH and A represents C=O, may be prepared from corresponding compounds of formula XXI:

- wherein X and R³ are as defined previously for compounds of formula XVIII, by using the Friedel-Crafts acylation reaction. Typical conditions are to use
- 5 ClC(O)R⁴, wherein R⁴ is as defined previously for compounds of formula XVIII, (1 to 3 equivalents) and, optionally, a Lewis acid (e.g. 2 to 10 equivalents AlCl₃) in an organic solvent (e.g. dichloromethane) at between 0°C and reflux temperature.
- 10 Alternatively, compounds of formula XVIII, may be prepared from corresponding compounds of formula XXII:

- 15 wherein R³, X and Y are as defined previously for compounds of formula XVIII, and Hal represents chloro, bromo or iodo, by conversion of Hal to AR⁴. This can be achieved by any one of the routes outlined below:
- (a) so-called "Heck" conditions (e.g. 2 equivalents of a source of an acyl anion equivalent (such as butyl vinyl ether), 1.7 equivalents of Et₃N and catalytic
- 20 amounts of Pd(OAc)₂ and P(o-tol)₃, in MeCN at between room temperature and reflux). Performing a Heck reaction on an alkyl alkenyl ether will give products where A represents C=O. Such reactions are not suitable when R⁴ is aryl; or
- (b) so-called "Sonogashira" conditions (for example as described in *Synthesis*
- 25 1980, 8, 627, such as 1.5 to 5 equivalents of a terminal alkyne and 0.024 to

- 0.03 equivalents of $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$ / CuI , in Et_3N and MeCN at between room temperature and 60°C), followed by hydrolysis of the resultant alkyne (typical conditions 0.3 equivalents HgSO_4 , H_2SO_4 , acetone at reflux). Note, this procedure will give products where A represents $\text{C}=\text{O}$. Such reactions are not
- 5 suitable when R^4 is aryl; or
- (c) Halogen/ lithium exchange followed by quenching onto an acyl chloride (to give products where A represents $\text{C}=\text{O}$). Alternatively, the anion may be quenched onto an aldehyde to give products where A represents CHOH . This alcohol may then be re-oxidised to the corresponding ketone by using
- 10 standard oxidising agents such as manganese dioxide. Preferred conditions for acyl chloride reaction: 1 to 2 equivalents of n-Butyl Lithium, 1 to 2 equivalents of R^4COCl in THF, at from about -78°C to about room temperature. If for example R^4COCl is LCH_2COCl (where L is a leaving group such as methanesulphonate, *p*-toluenesulphonate or halo, preferably chloro
- 15 or bromo), then once the above procedure has been performed the product can be further functionalised by displacement of L with a nucleophile (e.g. primary or secondary amine); or
- (d) Formation of Grignard or zincate through addition of magnesium or a zinc source (e.g. zinc, zinc chloride, Reike zinc), followed by quenching onto an
- 20 acyl chloride (to give products where A represents $\text{C}=\text{O}$). Alternatively the Grignard or zinc reagent may be quenched onto an aldehyde to give products where A represents CHOH . Again, the alcohol formed may be oxidised to give the required ketone as detailed hereinbefore; or
- (e) Carbonylation to yield a carboxylic acid, ester, or Weinreb amide. Preferred
- 25 conditions: CO (50psi), $\text{Pd}(\text{OAc})_2$ (0.03 equivalents), 1,1'-bis(diphenylphosphino)ferrocene (0.045 equivalents), triethylamine (5 equivalents), and suitable nucleophile (e.g. alcohol, amine) at from 40 to about 80°C . Alternatively the Weinreb amide may be synthesised from the carboxylic acid and the aldehyde may be synthesised from the ester or
- 30 carboxylic acid. The acid chloride may be formed from the carboxylic acid. Preferred conditions to form acid chloride from acid: $(\text{COCl})_2$ (1.2 equivalents), N,N-dimethylformamide (drop) in dichloromethane. A nucleophile such as a Grignard reagent or zincate may then be reacted with

the ester, Weinreb amide or acid chloride to yield products where A represents C=O. Alternatively, analogous reactions with the aldehyde would yield products where A represents CHOH. Preferred conditions for addition of Grignard reagent into acid chloride: RMgBr (1 equivalents), Fe(acac)₃ (0.03 equivalents) in THF.

Compounds of formulae VI, VII, IX, X, XXI, XXIII and derivatives thereof, when not commercially available or not subsequently described, may be obtained either by analogy with the processes described hereinbefore, or by conventional

When X represents O, R^3 can be exchanged for an alternative R^3 group (R^{3a}) at any step and in any of the processes described hereinbefore by reacting the
10 appropriate intermediate with $R^{3a}OH$ and a base (e.g. cesium carbonate) at reflux temperature (or, if performed in a sealed vessel, at greater than reflux temperature). Likewise, when X represents O, OR^3 can be exchanged for NR^3R^5 at any step and in any of the processes described hereinbefore by reacting the appropriate intermediate with HNR^3R^5 , optionally in the presence of catalytic
15 copper sulphate, at temperatures between room and reflux temperature (or, if performed in a sealed vessel, at greater than reflux temperature).

Compounds where A represents $CHOH$ can be prepared at any step and in any of the processes described hereinbefore from corresponding compounds where
20 A represents $C=O$. This transformation may be achieved by using a suitable reducing agent, preferably sodium borohydride in methanol. Likewise, compounds where A represents $C=O$ can be prepared at any step and in any of the processes described hereinbefore from corresponding compounds where A represents $CHOH$. This transformation may be achieved by using a suitable
25 oxidising agent (e.g. manganese dioxide).

The compounds of the invention may be isolated from their reaction mixtures using conventional techniques.

30 It will be appreciated by those skilled in the art that, in the course of carrying out the processes described above, the functional groups of intermediate compounds may need to be protected by protecting groups.

Functional groups which it is desirable to protect include hydroxy, amino and carboxylic acid. Suitable protecting groups for hydroxy include trialkylsilyl and diarylalkylsilyl groups (e.g. tert-butyldimethylsilyl, tert-butyldiphenylsilyl or trimethylsilyl), tetrahydropyranyl and alkylcarbonyl groups (e.g. methyl- and ethylcarbonyl). Suitable protecting groups for amino include tert-butyloxycarbonyl, 9-fluorenylmethoxycarbonyl or benzyloxycarbonyl. Suitable protecting groups for carboxylic acid include C₁₋₆ alkyl or benzyl esters.

The protection and deprotection of functional groups may take place before or after any of the reaction steps described hereinbefore.

Protecting groups may be removed in accordance with techniques which are well known to those skilled in the art.

Protection / deprotection strategies as appropriate may be employed such as are known in the literature. Suitable protecting groups for use in accordance with the invention can be found in "Protecting Groups" edited by P.J. Kocienski, Thieme, New York, 1994; and "Protective Groups in Organic Synthesis" 2nd edition, T.W. Greene & P.G.M. Wutz, Wiley -Interscience (1991).

Persons skilled in the art will also appreciate that, in order to obtain compounds of formula I in an alternative, and, on some occasions, more convenient, manner, the individual process steps mentioned hereinbefore may be performed in a different order, and/or the individual reactions may be performed at a different stage in the overall route (i.e. substituents may be added to and/or chemical transformations performed upon, different intermediates to those mentioned hereinbefore in conjunction with a particular reaction). This will depend inter alia on factors such as the nature of other functional groups present in a particular substrate, the availability of key intermediates and the protecting group strategy (if any) to be adopted. Clearly, the type of chemistry involved will influence the choice of reagent that is used in the said synthetic steps, the need, and type, of protecting groups that are employed, and the sequence for accomplishing the synthesis.

Pharmaceutically acceptable acid addition salts of the compounds of formula I that contain a basic centre may be prepared in a conventional manner. For example, a solution of the free base may be treated with the appropriate acid, either neat or in a suitable solvent, and the resulting salt may then be isolated either by filtration or by evaporation under vacuum of the reaction solvent. Pharmaceutically acceptable base addition salts can be obtained in an analogous manner by treating a solution of a compound of formula I with the appropriate base. Both types of salt may be formed or interconverted using ion-exchange resin techniques.

The present invention also includes all suitable isotopic variations of a compound of the formula (I) or a pharmaceutically acceptable salt thereof. An isotopic variation of a compound of the formula (I) or a pharmaceutically acceptable salt thereof is defined as one in which at least one atom is replaced by an atom having the same atomic number but an atomic mass different from the atomic mass usually found in nature. Examples of isotopes that can be incorporated into compounds of the formula (I) and pharmaceutically acceptable salts thereof include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, sulphur, fluorine and chlorine such as ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{17}O , ^{18}O , ^{31}P , ^{32}P , ^{35}S , ^{18}F and ^{36}Cl , respectively. Certain isotopic variations of the compounds of the formula (I) and pharmaceutically acceptable salts thereof, for example, those in which a radioactive isotope such as ^3H or ^{14}C is incorporated, are useful in drug and/or substrate tissue distribution studies. Tritiated, i.e., ^3H , and carbon-14, i.e., ^{14}C , isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with isotopes such as deuterium, i.e., ^2H , may afford certain therapeutic advantages resulting from greater metabolic stability, for example, increased in vivo half-life or reduced dosage requirements and hence may be preferred in some circumstances. Isotopic variations of the compounds of formula (I) and pharmaceutically acceptable salts thereof of this invention can generally be prepared by conventional procedures such as by the illustrative methods or by the preparations described in the Examples and Preparations hereafter using appropriate isotopic variations of suitable reagents.

It will be appreciated by those skilled in the art that certain protected derivatives of compounds of formula (I), which may be made prior to a final deprotection stage, may not possess pharmacological activity as such, but may, in certain instances, be administered orally or parenterally and thereafter metabolised in the body to form compounds of the invention which are pharmacologically active. Such derivatives may therefore be described as "prodrugs". Further, certain compounds of formula (I) may act as prodrugs of other compounds of formula (I).

- 10 All protected derivatives, and prodrugs, of compounds of formula (I) are included within the scope of the invention. Examples of suitable pro-drugs for the compounds of the present invention are described in Drugs of Today, Volume 19, Number 9, 1983, pp 499 – 538 and in Topics in Chemistry, Chapter 31, pp 306 – 316 and in "Design of Prodrugs" by H. Bundgaard, Elsevier, 1985, Chapter 1 (the disclosures in which documents are incorporated herein by reference).

It will further be appreciated by those skilled in the art, that certain moieties, known to those skilled in the art as "pro-moieties", for example as described by H. Bundgaard in "design of Prodrugs" (the disclosure in which document is incorporated herein by reference) may be placed on appropriate functionalities when such functionalities are present within compounds of formula (I).

Thus, the invention provides a method of treating or preventing a medical condition for which a cGMP PDE5 inhibitor is indicated, in an animal (e.g. a mammal, including a human being), which comprises administering a

therapeutically effective amount of a compound of the invention to a mammal in need of such treatment.

Pharmaceutical Preparations

5

The compounds will normally be administered orally or by any parenteral route, in the form of pharmaceutical preparations comprising the active ingredient, optionally in the form of a non-toxic organic, or inorganic, acid, or base, addition salt, in a pharmaceutically acceptable dosage form. Depending upon the
10 disorder and patient to be treated, as well as the route of administration, the compositions may be administered at varying doses.

The compounds may also be combined with any other drugs useful in the inhibition of cGMP-PDEs, such as cGMP-PDE5.

15

The compounds, their pharmaceutically acceptable salts, and pharmaceutically acceptable solvates of either entity can be administered alone but, in human therapy will generally be administered in admixture with a suitable pharmaceutical excipient diluent or carrier selected with regard to the intended
20 route of administration and standard pharmaceutical practice.

For example, the compounds or salts or solvates thereof can be administered orally, buccally or sublingually in the form of tablets, capsules (including soft gel capsules), ovules, elixirs, solutions or suspensions, which may contain flavouring
25 or colouring agents, for immediate-, delayed-, modified-, or controlled-release such as sustained-, dual-, or pulsatile delivery applications. The compounds may also be administered via intracavernosal injection. The compounds may also be administered via fast dispersing or fast dissolving dosages forms.

30 Such tablets may contain excipients such as microcrystalline cellulose, lactose, sodium citrate, calcium carbonate, dibasic calcium phosphate, glycine and starch (preferably corn, potato or tapioca starch), disintegrants such as sodium starch glycollate, croscarmellose sodium and certain complex silicates, and granulation

binders such as polyvinylpyrrolidone, hydroxypropylmethyl cellulose (HPMC), hydroxypropylcellulose (HPC), sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, stearic acid, glyceryl behenate and talc may be included.

5

Solid compositions of a similar type may also be employed as fillers in gelatin capsules. Preferred excipients in this regard include lactose, starch, a cellulose, milk sugar or high molecular weight polyethylene glycols. For aqueous suspensions and/or elixirs, the compounds of the invention may be combined
10 with various sweetening or flavouring agents, colouring matter or dyes, with emulsifying and/or suspending agents and with diluents such as water, ethanol, propylene glycol and glycerin, and combinations thereof.

Modified release and pulsatile release dosage forms may contain
15 excipients such as those detailed for immediate release dosage forms together with additional excipients that act as release rate modifiers, these being coated on and/or included in the body of the device. Release rate modifiers include, but are not exclusively limited to, hydroxypropylmethyl cellulose, methyl cellulose, sodium carboxymethylcellulose, ethyl cellulose, cellulose acetate, polyethylene
20 oxide, Xanthan gum, Carbomer, ammonio methacrylate copolymer, hydrogenated castor oil, carnauba wax, paraffin wax, cellulose acetate phthalate, hydroxypropylmethyl cellulose phthalate, methacrylic acid copolymer and mixtures thereof. Modified release and pulsatile release dosage forms may contain one or a combination of release rate modifying excipients. Release rate
25 modifying excipients may be present both within the dosage form i.e. within the matrix, and/or on the dosage form i.e. upon the surface or coating.

Fast dispersing or dissolving dosage formulations (FDDFs) may contain the following ingredients: aspartame, acesulfame potassium, citric acid,
30 croscarmellose sodium, crospovidone, diascorbic acid, ethyl acrylate, ethyl cellulose, gelatin, hydroxypropylmethyl cellulose, magnesium stearate, mannitol, methyl methacrylate, mint flavouring, polyethylene glycol, fumed silica, silicon dioxide, sodium starch glycolate, sodium stearyl fumarate, sorbitol, xylitol. The

terms dispersing or dissolving as used herein to describe FDDFs are dependent upon the solubility of the drug substance used i.e. where the drug substance is insoluble a fast dispersing dosage form can be prepared and where the drug substance is soluble a fast dissolving dosage form can be prepared.

5

The compounds can also be administered parenterally, for example, intracavernosally, intravenously, intra-arterially, intraperitoneally, intrathecally, intraventricularly, intraurethrally intrasternally, intracranially, intramuscularly or subcutaneously, or they may be administered by infusion techniques. For such
10 parenteral administration they are best used in the form of a sterile aqueous solution which may contain other substances, for example, enough salts or glucose to make the solution isotonic with blood. The aqueous solutions should be suitably buffered (preferably to a pH of from 3 to 9), if necessary. The preparation of suitable parenteral formulations under sterile conditions is readily
15 accomplished by standard pharmaceutical techniques well-known to those skilled in the art.

For oral and parenteral administration to human patients, the daily dosage level of the compounds or salts or solvates thereof will usually be from 10 to 500 mg
20 (in single or divided doses).

Thus, for example, tablets or capsules of the compounds or salts or solvates thereof may contain from 5mg to 250 mg of active compound for administration singly or two or more at a time, as appropriate. The physician in any event will
25 determine the actual dosage which will be most suitable for any individual patient and it will vary with the age, weight and response of the particular patient. The above dosages are exemplary of the average case. There can, of course, be individual instances where higher or lower dosage ranges are merited and such are within the scope of this invention. The skilled person will also appreciate
30 that, in the treatment of certain conditions (including MED and FSD), compounds may be taken as a single dose on an "as required" basis (i.e. as needed or desired).

Example Tablet Formulation

In general a tablet formulation could typically contain between about 0.01mg and
5 500mg of the compound (or a salt thereof) whilst tablet fill weights may range
from 50mg to 1000mg. An example formulation for a 10mg tablet is illustrated:

	<u>Ingredient</u>	<u>%w/w</u>
	"Active" Compound	10.000*
10	Lactose	64.125
	Starch	21.375
	Croscarmellose Sodium	3.000
	Magnesium Stearate	1.500

15 * This quantity is typically adjusted in accordance with drug activity.

Such tablets can be manufactured by standard processes, for example, direct
compression or a wet or dry granulation process. The tablet cores may be
coated with appropriate overcoats.

20

The compounds can also be administered intranasally or by inhalation and are
conveniently delivered in the form of a dry powder inhaler or an aerosol spray
presentation from a pressurised container, pump, spray or nebuliser with the use
of a suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane,
25 dichlorotetrafluoroethane, a hydrofluoroalkane such as 1,1,1,2-tetrafluoroethane
(HFA 134A [trade mark] or 1,1,1,2,3,3,3-heptafluoropropane (HFA 227EA [trade
mark])), carbon dioxide or other suitable gas. In the case of a pressurised
aerosol, the dosage unit may be determined by providing a valve to deliver a
metered amount. The pressurised container, pump, spray or nebuliser may
30 contain a solution or suspension of the active compound, e.g. using a mixture of
ethanol and the propellant as the solvent, which may additionally contain a
lubricant, e.g. sorbitan trioleate. Capsules and cartridges (made, for example,
from gelatin) for use in an inhaler or insufflator may be formulated to contain a

powder mix of the compound and a suitable powder base such as lactose or starch.

Aerosol or dry powder formulations are preferably arranged so that each metered
5 dose or "puff" contains from 1 to 50 mg of the compound for delivery to the patient. The overall daily dose with an aerosol will be in the range of from 1 to 50 mg which may be administered in a single dose or, more usually, in divided doses throughout the day.

10 The compounds may also be formulated for delivery via an atomiser. Formulations for atomiser devices may contain the following ingredients as solubilisers, emulsifiers or suspending agents: water, ethanol, glycerol, propylene glycol, low molecular weight polyethylene glycols, sodium chloride, fluorocarbons, polyethylene glycol ethers, sorbitan trioleate, oleic acid.

15

Alternatively, the compounds or salts or solvates thereof can be administered in the form of a suppository or pessary, or they may be applied topically in the form of a gel, hydrogel, lotion, solution, cream, ointment or dusting powder. The compounds or salts or solvates thereof may also be dermally administered. The
20 compounds or salts or solvates thereof may also be transdermally administered, for example, by the use of a skin patch. They may also be administered by the ocular, pulmonary or rectal routes.

For ophthalmic use, the compounds can be formulated as micronised
25 suspensions in isotonic, pH adjusted, sterile saline, or, preferably, as solutions in isotonic, pH adjusted, sterile saline, optionally in combination with a preservative such as a benzylalkonium chloride. Alternatively, they may be formulated in an ointment such as petrolatum.

30 For application topically to the skin, the compounds or salts or solvates thereof can be formulated as a suitable ointment containing the active compound suspended or dissolved in, for example, a mixture with one or more of the following: mineral oil, liquid petrolatum, white petrolatum, propylene glycol,

polyoxyethylene polyoxypropylene compound, emulsifying wax and water. Alternatively, they can be formulated as a suitable lotion or cream, suspended or dissolved in, for example, a mixture of one or more of the following: mineral oil, sorbitan monostearate, a polyethylene glycol, liquid paraffin, polysorbate 60, cetyl
5 esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

The compounds may also be used in combination with a cyclodextrin. Cyclodextrins are known to form inclusion and non-inclusion complexes with drug molecules. Formation of a drug-cyclodextrin complex may modify the solubility,
10 dissolution rate, bioavailability and/or stability property of a drug molecule. Drug-cyclodextrin complexes are generally useful for most dosage forms and administration routes. As an alternative to direct complexation with the drug the cyclodextrin may be used as an auxiliary additive, e.g. as a carrier, diluent or solubiliser. Alpha-, beta- and gamma-cyclodextrins are most commonly used
15 and suitable examples are described in WO-A-91/11172, WO-A-94/02518 and WO-A-98/55148.

Generally, in humans, oral administration of the compounds is the preferred route, being the most convenient and, for example in MED, avoiding the well-
20 known disadvantages associated with intracavernosal (i.c.) administration. A preferred oral dosing regimen in MED for a typical man is from 25 to 250 mg of compound when required. In circumstances where the recipient suffers from a swallowing disorder or from impairment of drug absorption after oral administration, the drug may be administered parenterally, sublingually or
25 buccally.

For veterinary use, the compound, or a veterinarily acceptable salt thereof, or a veterinarily acceptable solvate or pro-drug thereof, is administered as a suitably acceptable formulation in accordance with normal veterinary practice and the
30 veterinary surgeon will determine the dosing regimen and route of administration which will be most appropriate for a particular animal.

Thus, according to a further aspect there is provided a pharmaceutical formulation including a compound as detailed hereinbefore in admixture with a pharmaceutically or veterinarily acceptable adjuvant, diluent or carrier.

- 5 In addition to the fact that the compounds inhibit cyclic guanosine 3',5'-monophosphate phosphodiesterases (cGMP PDEs) and in particular, are potent and selective inhibitors of cGMP PDE5, the compounds may also have the advantage that they may be more efficacious than, be less toxic than, have a broader range of activity than, be more potent than, produce fewer side effects
10 than, be more easily absorbed than, or they may have other useful pharmacological properties over, compounds known in the prior art.

The biological activities of the compounds were determined by the following test methods.

15

Phosphodiesterase (PDE) inhibitory activity

- Compounds of the present invention are potent and selective cGMP PDE5 inhibitors. *In vitro* PDE inhibitory activities against cyclic guanosine 3',5'-
20 monophosphate (cGMP) and cyclic adenosine 3',5'-monophosphate (cAMP) phosphodiesterases were determined by measurement of their IC₅₀ values (the concentration of compound required for 50% inhibition of enzyme activity).

- The required PDE enzymes were isolated from a variety of sources, including
25 human corpus cavernosum, human platelets, human cardiac ventricle, human skeletal muscle and human and canine retina, essentially by the method of W.J. Thompson and M.M. Appleman (Biochem., 1971, 10, 311). In particular, the cGMP-specific PDE (PDE5) and the cGMP-inhibited cAMP PDE (PDE3) were obtained from human corpus cavernosum tissue or human platelets; the cGMP-
30 stimulated PDE (PDE2) was obtained from human corpus cavernosum or human platelets; the calcium/calmodulin (Ca/CAM)-dependent PDE (PDE1) from human cardiac ventricle; the cAMP-specific PDE (PDE4) from recombinant clone or human skeletal muscle; and the photoreceptor PDE (PDE6) from canine or

human retina. Phosphodiesterases 7-11 were generated from full length human recombinant clones transfected into SF9 cells.

Assays were performed either using a modification of the "batch" method of W.J. Thompson *et al.* (Biochem., 1979, 18, 5228) or using a scintillation proximity assay for the direct detection of AMP/GMP using a modification of the protocol described by Amersham plc under product code TRKQ7090/7100. In summary, the effect of PDE inhibitors was investigated by assaying a fixed amount of enzyme in the presence of varying inhibitor concentrations and low substrate, (cGMP or cAMP in a 3:1 ratio unlabelled to [³H]-labeled at a conc ~1/2 K_m) such that $IC_{50} \cong K_i$. The final assay volume was made up to 102 μ l with assay buffer [20 mM Tris-HCl pH 7.4, 5 mM MgCl₂, 1 mg/ml bovine serum albumin]. Reactions were initiated with enzyme, incubated for 30-60 min at 30°C to give <30% substrate turnover and terminated with 50 μ l yttrium silicate SPA beads (containing 3 mM of the respective unlabelled cyclic nucleotide for PDEs 3, 9 and 11). Plates were re-sealed and shaken for 20 min, after which the beads were allowed to settle for 30 min in the dark and then counted on a TopCount plate reader (Packard, Meriden, CT). Radioactivity units were converted to % activity of an uninhibited control (100%), plotted against inhibitor concentration and inhibitor IC_{50} values obtained using the 'Fit Curve' Microsoft Excel extension or in-house equivalent. Results from these tests show that the compounds of the present invention are potent and selective inhibitors of cGMP-specific PDE5.

25 In vitro metabolism

In vitro metabolism experiments were carried out in the hepatic microsomal fractions from man. Transplant-quality human liver tissue was obtained from the International Institute for the Advancement of Medicine (Exton, PA, USA). Microsomes were prepared according to the method described in *Biochemical Pharmacology*, 1966, 48, 2147-2156 and stored at -80°C. The concentrations of protein and cytochrome P450 were determined by standard methods described

in *Journal of Biological Chemistry*, **1951**, 193, 265-275 and *Journal of Biological Chemistry*, **1964**, 239, 2370-2378.

Microsomal incubations (1.5 ml) were prepared containing 0.5 μ M cytochrome
5 P450, 200 mM phosphate buffer (pH 7.4), 0.1 M $MgCl_2$, 0.1 M isocitric acid, 1
unit/ml isocitrate dehydrogenase and 20 mM β -NADP. Compounds under study
were added after a 5 min preincubation at 37°C to give an initial substrate
concentration of 1 μ M. The mixture was incubated at 37°C and samples (100 μ l)
were removed for analysis for up to 60 min. Metabolism in samples was
10 terminated by the addition of NaOH (0.1 M) containing an internal standard
(chosen to have similar physicochemical properties to compounds under study),
followed by extraction into ethyl acetate (2 ml). The extracts were evaporated to
dryness and analysed by LC-MS/MS (Hewlett Packard HP1100 binary pump,
Hypersil HS100 C18, 5 cm by 4.6 mm internal diameter, 5 μ m column using a
15 mobile phase of 2mM ammonium acetate in 90:10 methanol/water, aqueous
portion adjusted to pH 4 with glacial acetic acid, and a flowrate of 1 ml/min). The
mass spectrometer was a Sciex API 2000 with TurbolonSpray interface using a
positive ion multiple reaction monitoring (MRM) detection mode. Nitrogen was
used as curtain, nebuliser, TurbolonSpray and collision gases, and the
20 TurbolonSpray temperature was 100°C. Typical voltages were as follows: IS =
5.2 kV; RNG = 380 V; Q0 = -10 V; IQ1 = -11 V; ST = -15; RO1 = -11 V; MU = gain
adjusted as per Sciex user manual. Collision energy was 55 eV for high MRM,
OR = 65 V. Dwell time was 200 msec with a 50 msec pause. Data was
acquired using MSExpress v 1.1 and processed using Macquan 1.5 (PE Sciex)).
25 Disappearance rate constants (k) in human microsomal preparations were
determined by linear regression of the log ratio (compound under study/internal
standard) versus time. The *in vitro* human microsomal half-lives were
determined according to the equation $t_{1/2} = \ln 2/k$. Results from these studies
show that the compounds of the present invention demonstrate desirable human
30 liver microsome (HLM) half-lives.

Those skilled in the art will recognise that an increase in HLM half-life is predictive of reduced clearance in man for compounds cleared predominantly by cytochrome P450 mediated metabolism.

- 5 A particular advantage of compounds of the invention, such as for example the compound of Example 1, is desirable *in vitro* microsomal half-lives. Particularly preferred compounds herein have 2-fold preferably 4-fold and more preferably 5-fold improvements versus compound of the art. Such improved *in vitro* microsomal half-lives are indicative of reduced clearance *in vivo*.

10

Preferred compounds of formula (I) herein have IC_{50} values of less than about 10nM for the PDE5 enzyme. A more preferred group of compounds have IC_{50} values of less than about 5nM for the PDE5 enzyme. Highly preferred herein are compounds which have IC_{50} values of less than about 3nM for the PDE5

15 enzyme.

In addition, preferred compounds of formula (I) herein have greater than 5-fold selectivity for the PDE5 enzyme versus the PDE6 enzyme. Highly preferred herein are compounds having greater than 10-fold selectivity for the PDE5

20 enzyme versus the PDE6 enzyme. More preferable herein are compounds having greater than 20-fold selectivity for the PDE5 enzyme versus the PDE6 enzyme and especially preferred are compounds having greater than 30-fold selectivity for the PDE5 enzyme versus the PDE6 enzyme.

- 25 Especially preferred herein are compounds which have an IC_{50} value of less than about 10, more preferably less than about 5 nM and especially less than about 3nM for the PDE5 enzyme in combination with greater than 10-fold, preferably greater than about 20-fold and especially greater than 30-fold selectivity for the PDE5 enzyme versus the PDE6 enzyme.

30

As detailed hereinbefore preferred compounds herein have desirable human liver microsome (HLM) half-lives. Especially preferred herein are compounds having HLM half-lives of greater than about 20 minutes, more preferably greater than 60

minutes, and most preferably greater than 120 minutes. Such HLM values can be measured according to the methods detailed hereinbefore.

Thus an especially preferred group of compounds herein have an IC_{50} value of less than about 10, more preferably less than about 5 nM and especially less than about 3nM for the PDE5 enzyme in combination with greater than 10-fold, preferably greater than about 20-fold and especially greater than 30-fold selectivity for the PDE5 enzyme versus the PDE6 enzyme and HLM half-lives of greater than about 20 minutes.

10

Functional activity

This can be assessed *in vitro* by determining the capacity of a compound of the invention to enhance sodium nitroprusside-induced relaxation of pre-contracted rabbit corpus cavernosum tissue strips, as described by S.A. Ballard *et al.* (Brit. J. Pharmacol., 1996, 118 (suppl.), abstract 153P).

20

In vivo activity

In vivo activity can be tested by screening test compounds in anaesthetised dogs to determine their capacity, after i.v. administration, to enhance the pressure rises in the corpora cavernosa of the penis induced by intracavernosal injection of sodium nitroprusside, using a method based on that described by Trigo-Rocha *et al.* (Neurourol. and Urodyn., 1994, 13, 71).

25

Safety Profile

The compounds may be tested at varying i.v and p.o. doses in animals such as mouse and dog, observing for any untoward effects.

30

Examples and Preparations

The synthesis of the compounds of general formula (I) and of the intermediates for use therein can be achieved by analogy with the processes of the Examples and Preparations hereinafter.

- 5 ¹H nuclear magnetic resonance (NMR) spectra were recorded using either a Varian Unity 300 or a Varian Inova 400 spectrometer and were in all cases consistent with the proposed structures. Characteristic chemical shifts (δ) are given in parts-per-million downfield from tetramethylsilane using conventional abbreviations for designation of major peaks: e.g. s, singlet; d, doublet; t, triplet;
10 q, quartet; m, multiplet; br, broad.

- Mass spectra (m/z) were recorded using a Fisons Instruments Trio mass spectrometer in the thermospray ionisation mode (TSP) or using a Finnigan navigator in electrospray ionisation mode (ES) - positive and/or negative
15 ionisation mode.

As used herein, the term "column chromatography" refers to normal phase chromatography using silica gel (0.04-0.06 mm).

- 20 Room temperature includes 20 to 25°C.

25 Preparative Examples

Preparation 1

N-Propionylalanine

- Trimethylsilyl chloride (52.4 ml, 0.41 mol) was added dropwise to an ice-cooled
30 solution of D,L-alanine (16.71 g, 0.188 mol) and triethylamine (57.5 ml, 0.41 mol) in dichloromethane (190 ml). Once addition was complete, the solution was stirred at room temperature for 1 h, followed by 1 h at 40°C. The solution was then cooled to -10°C, propionyl chloride (16.29 ml, 0.188 mol) was added dropwise over 15 minutes and, once addition was complete, the reaction was

stirred at -10°C for 2 h, then 16 h at room temperature, before cooling in an ice-bath. Water (100 ml) was added, the mixture was stirred for 15 minutes, then the phases separated. The aqueous layer was evaporated under reduced pressure and the residue triturated with acetone. The resulting solid was filtered off, and the filtrate concentrated under reduced pressure, to give an oil. This oil was purified by column chromatography using DCM:MeOH:0.88 NH₃ (aq) (89:10:1) as eluant, to give the title compound (20 g; containing 33% triethylamine).

The solution was then re-cooled to -60°C, and magnesium bromide diethyl etherate (30.73 g, 119 mmol) was added portionwise, so as to maintain an internal temperature of less than -50°C. The mixture was then

allowed to warm to -5°C , stirred for 30 minutes, and re-cooled to -10°C . A solution of the title compound of Preparation 2 (2.8 g, 14.9 mmol) in THF (20 ml) was added dropwise, and the reaction then stirred at room temperature for 3 h. The mixture was poured into 10% aqueous citric acid solution (500 ml) and

^1H NMR (CDCl_3 , 300 MHz): δ = 1.18 (t, 3H), 1.38 (m, 6H), 2.23 (q, 2H), 3.83 (q,
10 2H), 4.54 (d, 1H), 5.24 (m, 2H), 6.35 (m, 1H)

Preparation 4

Ethyl 2-oxo-3-(propionylamino)butanoate

15 **Method A**

Oxygen was bubbled through a cooled (-78°C) solution of the title compound of Preparation 3 (1.0 g, 5.98 mmol) and pyridine (3.25 ml, 44.9 mmol) in DCM (85 ml) for 2 min. Ozone was then bubbled through for 5 min and the solution then purged with oxygen, and placed under a nitrogen atmosphere. Dimethylsulphide
20 (3.25 ml, 44.9 mmol) was added dropwise over 5 minutes, the solution stirred for 1 h, and then allowed to warm to room temperature. The mixture was washed with water, dried (Na_2SO_4), filtered and evaporated under reduced pressure to give an oil. The crude product was purified by column chromatography using an elution gradient of DCM: Et_2O (100:0 to 50:50) to afford the title compound (395

30 and THF (75 ml). The solution was heated to reflux and then ethyl oxalyl chloride (16.8 ml, 150 mmol) was added dropwise over 1 h. For the first half of the addition, the reaction mixture stayed as a solution, however as more ethyl oxalyl

chloride was added a white precipitate formed which did not redissolve. The mixture was heated for a further 3 h and then poured onto ice water (200 ml). The mixture was extracted with EtOAc (3x200 ml) and the combined organics were dried (MgSO₄), filtered and concentrated *in vacuo* to afford a pale brown oil.

5 NaHCO₃ (3.58 g, 42.7 mmol) and EtOH (25 ml) were added and the mixture heated to reflux for 3.5 h. The reaction was cooled and filtered. The filtrate was concentrated to a pale brown oil. The crude product was purified by column chromatography (Pentane/EtOAc, 80:20 to 20:80) to afford the title compound as a yellow oil (3.95 g, 20.0 mmol, 26%).

¹H NMR (d₆-DMSO, 400 MHz): δ = 0.90 (t, 3H), 1.40 (m, 2H), 1.65 (m, 2H), 4.30 (t, 2H), 7.00 (m, 1H), 8.05 (d, 2H), 8.30 (d, 1H)

25 LRMS : *m/z* 196.3 (MH⁺)

Preparation 6

2-Butoxy-5-iodonicotinic acid

A mixture of the title compound of Preparation 5 (3.46 g, 17.7 mmol) and N-

30 iododisuccinimide (6 g, 26.6 mmol) in trifluoroacetic acid:trifluoroacetic anhydride

(4:1, 35 ml) was heated under reflux for 24 hours, with the exclusion of light. The cooled reaction mixture was concentrated under reduced pressure and the residue dissolved in EtOAc. PCT/IB 02/00854**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claims 17-18 are directed to a diagnostic method practised on the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
1-18 (all in part)

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210
